The security assessment of http://host.docker.internal:8888/ revealed a concerning situation with 35 total findings, including 2 high-severity vulnerabilities. An attacker could potentially exploit these weaknesses to gain unauthorized access to sensitive data or disrupt service. The presence of outdated components, broken access control, and security misconfiguration increases the risk of a data breach, compliance issues, and reputational damage. To mitigate these risks, we recommend prioritizing the update of Apache to a newer version to address the known vulnerabilities, followed by implementing security best practices such as enabling the Strict-Transport-Security Header and migrating to a secure HTTPS site. By addressing these vulnerabilities, we can significantly reduce the risk of a security incident and protect the organization's assets.

**Disclaimer:** This report is generated by an automated scanner and AI analysis tool. It is intended as a first-pass security assessment and does not replace a professional penetration test. Automated tools may produce false positives. Human review is recommended before acting on findings.

# Vulnerability Findings (35 total)

| Severity | Vulnerability | OWASP Category | CVSS | Affected URL | Recommendation |
